Final Project

PREDICTIVE ANALYTICS USING SAS

Rama Vidya Reddy Sushanth Chintalapati Sanjukta Shreekant Ajinkya Sai Sumanth Chilukuri Roshni Arul

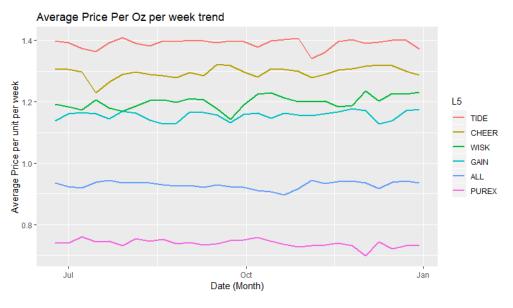

From the above plots it is clear the Tide is the market leader with 38.27% share in the market and selling over 9 Million units. On the other hand, our brand "WISK" has a market share of 6.18% having sold close to 2 Million units and making over 12 Million in dollar sales.

Store Location

| Market Location | Dollar Sales |
|-----------------|--------------|
| NEW YORK | 1,397,801 |
| LOS ANGELES | 844,022 |
| CHICAGO | 704,554 |
| BOSTON | 632,258 |
| WASHINGTON, DC | 599,005 |
| PHILADELPHIA | 554,809 |
| NEW ENGLAND | 462,392 |
| KANSAS CITY | 40,350 |
| GREEN BAY | 34,039 |
| EAU CLAIRE | 32,823 |
| TULSA,OK | 23,584 |
| DES MOINES | 22,395 |
| SPOKANE | 22,234 |
| OKLAHOMA CITY | 15,867 |

The Highlighted regions are the top 7 locations and the others are the bottom 7 locations in terms of the revenue incurred. This makes perfect sense as all the densely populated areas account for the top sales while all the other poorly populated regions account for the lowest contribution to the revenue.

Price (per Oz) variation

From the above it is clear that the price variation per oz. is pretty much the same with time among all the brands, with "WISK" having the highest fluctuations. It is also clear that our brand falls under the average pricing bracket while "TIDE" falls in the high price (premium) and "PUREX" in the lowest priced ones among the top 6 most selling brands.

RFM (Recency, Frequency and Monetary)

RFM stands for Recency, Frequency, and Monetary value, each corresponding to some key customer trait. RFM is a method used for analyzing customer value. These RFM metrics are important indicators of a customer's behavior because frequency and monetary value affects a customer's lifetime value, and recency affects retention, a measure of engagement.

In our data we took a subset of all the laundry detergent brands from the scanner data to get the data about the brand that we were interested in the brand "Wisk".

By performing RFM analysis on the new data, we get the following data:

The SAS System

The MEANS Procedure

| Variable | Minimum | 20th Pctl | 40th Pctl | 60th Pctl | 80th Pctl | Maximum |
|-----------|------------|-------------|-------------|-----------|------------|-------------|
| MONETARY | 13.1000000 | 217.4000000 | 508.4700000 | | 2800.15 | 25567.77 |
| FREQUENCY | 2.0000000 | 9.0000000 | 17.0000000 | | 50.0000000 | 291.0000000 |
| RECENCY | 0 | 2.0000000 | 5.0000000 | | 20.0000000 | 51.0000000 |

Customer Composition of Wisk

40%

7%

Others

Champions

■ Most Loyal

Highest Paying

New Customers

Using this we further divided the data into different segments to acquire the different types of customers. By doing this we will be able to determine how to cater to the different customers.

CUSTOMER SEGMENTATION:

Champions/Best Customers (Segment 1):

These are people who are top priority customers who have a good rapport with the brand overall, which means they are heavy spenders, buy very frequently and also recently.

Frequency and monetary values fall in the or greater than the 80^{th} percentile region (>50 and >\$2800) and recency in the less than 20^{th} percentile region (<2).

What can be done?

> Loyal Customers (Segment 2):

These are the ones who have been buying your brand very frequently and naturally will also be spending more.

So, if frequency is more than the 60^{th} percentile (>28) then they fall in this category. What can be done?

We can offer special discount coupons or rewards for such repeat customers.

➤ **Highest Paying** (Segment 3):

These customers are the ones who spend the most on your brand compared to all the other customers.

These customers have monetary value which is higher than the 80^{th} percentile (>\$2800). What can be done?

These customers are willing to pay high products and are not very affected if prices are high. So, a good idea for such customers can be to offer them premium/luxury products if you have any in your brand.

> New Customers (Segment 4):

These are the ones who have a good overall performance, are recent purchasers but are not very frequent buyers.

Recency less than 20^{th} percentile (<2), Frequency < 40^{th} (<17) percentile and Monetary value > 60^{th} percentile (>\$1165).

What can be done?

Build a relationship with such customers by providing them personal assistance and give them offers. These people could become your potential loyal customers.

➤ At Risk Customers (Segment 0/Others):

Customers who are spent a lot of money and bought often but hadn't made any purchase in the recent times.

Frequency > 80th percentile (>50), Monetary > 80th percentile (>\$2800).

What can be done?

Since they haven't made a purchase in a really long time, sending them reminder emails/promotions would be a great strategy to bring them back.

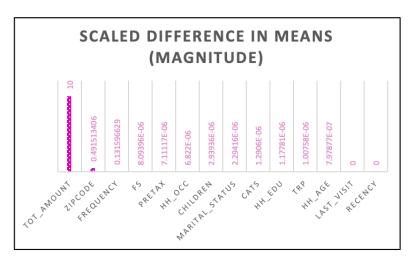

Logit Model Analysis:

While we analyzed the customers who bought Wisk, we wished to differentiate the customers who frequently bought our product (1) and the ones who did not (0).

We used a logistic regression here. It is different from simple regression because the only assumption is that the error terms are not correlated. The dependant variable holds a binary levelled response [1/0]; so proc logistic is a good choice of procedure.

The total amount (sum of dollars) and the frequency (count of the week) was assessed. The customers who fell in the 75th percentile (third quartile) were used as a threshold for the creating new dependant variable 'Repeating_customers' and label them as the customers who frequently bought our product (1) and the ones who did not (0).

The independent variables 'pretax', 'FS', 'TRP', Zipcode, 'HH_AGE', 'HH_EDU', 'HH_OCC', 'Cats', Children, Marital_Status were chosen with the difference of means method.

Partial Test

| Model Fit Statistics | | | | | | | |
|----------------------|----------------|-----------------------------|--|--|--|--|--|
| Criterion | Intercept Only | Intercept and Covariates | | | | | |
| AIC | 5978826.4 | 4613806.2 | | | | | |
| sc | 5978840.1 | 4615157.3 | | | | | |
| -2 Log L | 5978824.4 | 4613608.2 | | | | | |

Global Test

| Testing Global Null Hypothesis: BETA=0 | | | | | | | |
|--|------------|----|------------|--|--|--|--|
| Test | Chi-Square | DF | Pr > ChiSq | | | | |
| Likelihood Ratio | 1365216.20 | 98 | <.0001 | | | | |
| Score | 1005492.08 | 98 | <.0001 | | | | |
| Wald | 372908.886 | 98 | <.0001 | | | | |

From the model fit statistics of the proc logistic regression, we see that the model with the explanatory variables performs better than the naïve model (the AIC, SC and -2LogL values are lower for the full model as compared to the null model).

From Testing Global Null Hypothesis, our model is significant even at the 0.0001% level.

| Parameter | | DF | Estimate | Standard Error | Wald Chi-Square | Pr > ChiSq | Exp(Est) |

Interpreting Significant Coefficients:

- The odds of a customer frequently purchasing our brand increases 1.322 times for a house with pretax income range \$12,000 to \$14,999 per year as compared to a house with a combined per-tax income of \$100,000 and greater income per year.
- The odds of a customer frequently purchasing our brand increases 0.705 times for a family of four people as compared to a family of 6 or more people.
- The odds of a customer frequently purchasing our brand increases 1.619 times when the type of residential possession is owned as compared to rented.
- The odds of a customer frequently purchasing our brand increases 1.366 times when the age of the household is 45-54 as compared to the households with age 65+.
- The odds of a customer frequently purchasing our brand increases 1.355 times when the household education is some graduate school or less as compared to household education of post graduate work.
- The odds of a customer frequently purchasing our brand increases 2.669 times when the household as an occupation as 'other' as compared to a household which is not employed.
- The odds of a customer frequently purchasing our brand increases 0.364 times when the customer has three cats vs. a customer having 5+ cats.

- The odds of a customer frequently purchasing our brand increases 1.519 times when the household has children in age group (0-5), (6-11) and (12-17) as compared to family size>0 yet no children.
- The odds of a customer frequently purchasing our brand increases 0.538 times when the the customer is married vs. when the customer is separated.

| Association of Predicted | Probabilities and | Observed Re | sponses |
|--------------------------|-------------------|-------------|---------|
| Percent Concordant | 80.5 | Somers' D | 0.613 |
| Percent Discordant | 19.2 | Gamma | 0.615 |
| Percent Tied | 0.3 | Tau-a | 0.185 |
| Pairs | 5.8755036E12 | С | 0.807 |

80.7% of the times our model will correctly sort a repeating customer from a non-repeating customer.

In the random pairs of observations from the group of customers who do not buy our brand frequently and the group of customers who buy our brand frequently, the predicted probability (phat) for the observation from the frequent customer group should be greater than the phat for the observation from the non-frequent customer group. The percent concordant for every observation pair in our model where p-hat (1) > p-hat (0) is 80.5%.

Managerial Recommendations:

In the above interpretations, the odds of being a frequent customer were observed. These were the customers who were above our threshold set in the 75^{th} percentile. From the same table we can see which groups of customers are buying the detergent 'Wisk' less frequently. This group of customers obtained from our model should be targeted by the management. These customers are the ones in the 2^{nd} quartile.

For example, some of our desired target groups could be; households with children in the age groups (6-11) & (2-17), households with a family size of 3, households with an occupation- craftsman or customers who are divorced.
